

Define the Haldane constant, the binding capacity of hemoglobin, the vapor pressure of water at body temperature, and endogenous carbon monoxide production rate, and the oxygen pressure differential between the saturated alveoli and the pulmonary capillaries as constants.

$$M := 218 \quad H_f := 1.38 \frac{\text{mL}}{\text{g}} \quad P_{\text{H}_2\text{O}} := 47 \text{ mmHg} \quad V_{\text{CO}} := 0.007 \frac{\text{mL}}{\text{min}} \quad \Delta P_a := 49 \text{ mmHg}$$

Calculate the partial pressure of inspired carbon monoxide during the elimination phase with Equation 18 from the ambient pressure and the fraction of carbon monoxide in the air

$$P_B := 700 \text{ mmHg} \quad x_{\text{CO}} := 4 \text{ ppm} \quad P_{\text{I.CO.e}} := x_{\text{CO}} \cdot (P_B - P_{\text{H}_2\text{O}}) \quad P_{\text{I.CO.e}} = 0.002612 \text{ mmHg}$$

Calculate the mean pulmonary capillary oxygen pressure during the elimination phase with Equation 19 from the fraction of oxygen in the air.

$$x_{\text{O}_2} := 21 \% \quad P_{\text{C.O}_2.\text{e}} := x_{\text{O}_2} \cdot (P_B - P_{\text{H}_2\text{O}} - P_{\text{I.CO.e}}) - \Delta P_a \quad P_{\text{C.O}_2.\text{e}} = 88.12945 \text{ mmHg}$$

Calculate the diffusion rate for an employee who is resting during the elimination phase with Equation 20 and the appropriate value from Table 1.

$$D_{\text{L.e}} := 20 \frac{\text{mL}}{\text{min mmHg}} \quad D_{\text{L.e}} := \frac{D_{\text{L.e}}}{1 + 0.0031 \cdot \left(x_{\text{O}_2} \cdot \left(\frac{P_B - P_{\text{H}_2\text{O}}}{\text{mmHg}} \right) - 150 \right)} \quad D_{\text{L.e}} = 20.8311 \frac{\text{mL}}{\text{min mmHg}}$$

Calculate the alveolar ventilation for an employee who is resting during the elimination phase with Equation 21 and the appropriate value from Table 1.

$$V_{\text{A.e}} := 6 \frac{\text{L}}{\text{min}} \quad V_{\text{A.e}} := V_{\text{A.e}} \cdot \left(\frac{P_B - P_{\text{H}_2\text{O}}}{760 \text{ mmHg}} \right) \cdot \left(\frac{273.15 \text{ K}}{310.15 \text{ K}} \right) \quad V_{\text{A.e}} = 4.540255 \frac{\text{L}}{\text{min}}$$

Calculate β for the elimination phase with Equation 2.

$$\beta_e := \frac{1}{D_{\text{L.e}}} + \left(\frac{P_B - P_{\text{H}_2\text{O}}}{V_{\text{A.e}}} \right) \quad \beta_e = 11.509780 \frac{\text{mmHg sec}}{\text{mL}}$$

Calculate Q, R, and S for the elimination phase with Equations 11, 12, and 13 from amount of hemoglobin in the blood.

$$\text{Hb} := 15.8 \frac{\text{gram}}{100 \text{ mL}} \quad Q_e := \beta_e \cdot M \cdot V_{\text{CO}} + M \cdot P_{\text{I.CO.e}} + P_{\text{C.O}_2.\text{e}} \quad Q_e = 88.99160 \text{ mmHg}$$

$$R_e := H_f \cdot \text{Hb} \cdot P_{\text{C.O}_2.\text{e}} \quad R_e = 19.21575 \text{ mmHg}$$

$$S_e := H_f \cdot \text{Hb} \cdot M \cdot (V_{\text{CO}} \cdot \beta_e + P_{\text{I.CO.e}}) \quad S_e = 0.187983 \text{ mmHg}$$

Calculate the concentration of COHb in the blood from the measured fraction of COHb in the blood when it was measured.

$$\% \text{COHb}_c := 15 \% \quad \text{COHb}_c := \% \text{COHb}_c \cdot H_f \cdot \text{Hb} \quad \text{COHb}_c = 0.032706$$

Use a nonlinear equation solver with Equation 10 to find the COHb concentration at the beginning of the elimination phase from the duration of the elimination phase and the volume of blood in the body.

$$\Delta t_c := 120 \text{ min} \quad V_b := 5 \text{ L}$$

$$\text{COHb}_B := \text{solve} \left(\ln \left(\frac{\text{COHb}_B \cdot Q_e - S_e}{\text{COHb}_c \cdot Q_e - S_e} \right) = \frac{Q_e}{R_e} \cdot \left(\frac{\Delta t_c \cdot Q_e}{V_b \cdot \beta_e \cdot M} + \text{COHb}_B - \text{COHb}_c \right), \text{COHb}_B, \text{COHb}_c, 3 \cdot \text{COHb}_c \right)$$

Calculate the percent COHb in the blood at the beginning of the elimination phase.

$$\% \text{COHb}_B := \frac{\text{COHb}_B}{H_f \cdot \text{Hb}} \quad \% \text{COHb}_B = 19.58675 \%$$
